

Common Errors for Unit 7

Level 1 Web page Creation and Level 2 Website Creation

CLAiT Level 1

Unit 7 Web Page Creation

On the HTML source code print, mailto: and/or http:// protocol missing from the external links (3b, c) = critical error for each incorrect link.

Text not displayed in full on the web page printout (text is 'cut off' on the right side of the page) (2b) = critical error.

CLAiT Plus Level 2

Unit 7 Website Creation

This is the least well assessed of all CLAiT Plus Units.

Many local assessors do not identify inoperative links or missing images which results in critical errors. Centres are advised to assess the work electronically outside of the candidate user area, or to carefully check the HTML to ensure that all links to images are relative and not absolute.

Common errors not identified by the Centre assessors are:

Failure to set the input attributes for the submit button correctly which results in an inoperative form (3c) = critical error.

Using hyperlinks to internal pages causes problems for some candidates; this is generally due to the candidate making a keying in error in the filename (4c) = critical error.

By far the most common reasons for failure in this unit are links to images being absolute instead of relative, resulting in the images not being displayed on the webpage when submitted to the Examiner-Moderator (4e) = critical error.

There needs to be far more emphasis on testing the webpage items to ensure the final product is fit for purpose.
