INSTRUCTIONS TO CANDIDATES

- Write your name, centre number and candidate number in the boxes above. Please write clearly and in capital letters.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Answer all the questions.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Write your answer to each question in the space provided. Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Do not write in the bar codes.

INFORMATION FOR CANDIDATES

- Your quality of written communication is assessed in questions marked with a pencil (pencil).
- A list of useful relationships is printed on page 2.
- The number of marks is given in brackets [ ] at the end of each question or part question.
- The total number of marks for this paper is 60.
- This document consists of 16 pages. Any blank pages are indicated.
Useful relationships

The Earth in the Universe

distance = wave speed × time

wave speed = frequency × wavelength

Sustainable energy

energy transferred = power × time

power = voltage × current

efficiency = \frac{\text{energy usefully transferred}}{\text{total energy supplied}} \times 100\%

Explaining motion

speed = \frac{\text{distance travelled}}{\text{time taken}}

acceleration = \frac{\text{change in velocity}}{\text{time taken}}

momentum = \text{mass} \times \text{velocity}

change of momentum = \text{resultant force} \times \text{time for which it acts}

work done by a force = \text{force} \times \text{distance moved in the direction of the force}

amount of energy transferred = \text{work done}

change in gravitational potential energy = \text{weight} \times \text{vertical height difference}

kinetic energy = \frac{1}{2} \times \text{mass} \times [\text{velocity}]^2

Electric circuits

power = \text{voltage} \times \text{current}

resistance = \frac{\text{voltage}}{\text{current}}

\frac{\text{voltage across primary coil}}{\text{voltage across secondary coil}} = \frac{\text{number of turns in primary coil}}{\text{number of turns in secondary coil}}

Radioactive materials

energy = \text{mass} \times [\text{speed of light in a vacuum}]^2
1 Read the following article.

Some cancers are treated with a form of radiation therapy called permanent brachytherapy. A small radioactive source is placed inside a tumour. The source then decays over time, releasing ionising radiation that breaks down the tumour.

(a) (i) Link each phrase from the article to its correct meaning.

<table>
<thead>
<tr>
<th>phrase</th>
<th>meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>radioactive source</td>
<td>a substance that produces alpha, beta or gamma radiation</td>
</tr>
<tr>
<td>ionising radiation</td>
<td>the time taken for half of a radioactive substance to turn into another substance</td>
</tr>
<tr>
<td>decay</td>
<td>the particles in a sample naturally change from one element to another</td>
</tr>
<tr>
<td></td>
<td>energy is released by a chain reaction</td>
</tr>
</tbody>
</table>

(ii) The radioactive source in the tumour gives out one type of ionising radiation. A small amount of the radiation can be detected outside the body. This shows that one type of radiation is definitely not produced by the source. Put a (ring) around the correct choice to complete each sentence.

The source does not produce alpha / beta / gamma radiation. This is the least penetrating / evaporating / decaying type of radiation, so it would / would not pass out of the body.
(b) Which two statements, when taken together, explain why the ionising radiation “breaks down the tumour”?

Put ticks (✓) in the boxes next to the two correct statements.

Ionising radiation...

... can cause chemical reactions to take place. [ ]
... is not affected by chemical processes. [ ]
... can cause cells to become cancerous. [ ]
... is produced from the nuclei of atoms. [ ]
... decays over time. [ ]
... kills living cells. [ ]

[2]

(c) For brachytherapy to be effective, the source implanted into the tumour must have an activity that is high enough to kill the tumour, but drops to background levels soon after.

A doctor has a choice of four different sources to treat a tumour.

• Each source produces the same type of radiation.
• He knows that the source he chooses must have an activity of not more than 4 decays per second at the end of the treatment.
• The treatment lasts one year.
• Each source starts with an activity of 32 decays per second.

<table>
<thead>
<tr>
<th>source</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
<tbody>
<tr>
<td>half life</td>
<td>2 months</td>
<td>3 months</td>
<td>6 months</td>
<td>2 years</td>
</tr>
</tbody>
</table>

Which source should the doctor use to treat this tumour?

Justify your answer.

source ............................................. [3]
Denis wants to know if he should have brachytherapy for a cancer in his prostate gland.

He finds the following information:

- the therapy is successful in most cases
- 2 out of 125 patients in a study who had brachytherapy for prostate cancer went on to develop a cancer in a nearby organ as well.

Denis decides to go ahead with the therapy.

Suggest why he came to this conclusion, using this information.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................

(ii) When doing his research, Denis finds information about the dose from different treatments.

Explain what dose means.

Some scientists believe that nuclear fusion will be a major source of energy.

Currently, nuclear power stations use nuclear **fission** to generate electricity.

- Fission of uranium-235 releases $3.2 \times 10^{-11}$ J per event.
- Fusion of hydrogen-1 releases $2.8 \times 10^{-12}$ J per event.

Compare how nuclear fusion and nuclear fission release energy.

*The quality of written communication will be assessed in your answer.*
Judy is investigating three different electrical components, A, B and C.

She changes the temperature of each component and measures the resistance.

She then changes the amount of light on each component and measures the resistance.

<table>
<thead>
<tr>
<th>Temperature in °C</th>
<th>Component A (Ω)</th>
<th>Component B (Ω)</th>
<th>Component C (Ω)</th>
</tr>

Vikram is building a circuit.

(a) He has a motor that has a resistance of 2400 Ω.

The motor works if the current through it is 0.005 A.

Vikram has some 1.5V batteries.

How many batteries will be needed to make the motor work correctly?

number of batteries = .......................................................... [3]

(b) Draw the circuit that Vikram could use to measure the resistance of the motor at different currents.

Part of the circuit has been done for you.
A mobile phone manufacturer is designing a charger for a new phone. The charger will plug into the 230 V mains supply, and will change the voltage to 12 V. The charger consists of a transformer with two coils of wire around an iron core. The table shows two different pairs of coils which could be used in this transformer.

Complete the table.

<table>
<thead>
<tr>
<th>Number of turns in primary coil</th>
<th>Number of turns in secondary coil</th>

..............................................................................................................................
..............................................................................................................................
..............................................................................................................................
..............................................................................................................................

(b) The forces on a shoe as it starts to move down a slope are shown in the diagram.

(i) Each force is part of an interaction pair.

Complete the following sentences.

The pair force of the friction from the surface on the shoe is ...........................................
..............................................................................................................................
The pair force of the weight of the shoe is .................................................................
..............................................................................................................................
(ii) Describe the resultant force on the shoe as it starts to move down the slope.

................................................................................................................................................. [1]

(c) Ross measures the **time** it takes for the shoe to move down the slope, the **weight** of the shoe and the **mass** of the shoe.

He then measures the following distances:

![Diagram of a slope with labeled measurements](image)

He wants to calculate a number of different values using **only** his data.

Which **quantities** does he use to work out each **calculated value**?

Put ticks (✓) in the correct boxes in each row.

<table>
<thead>
<tr>
<th>Calculated value</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Time</td>
</tr>
<tr>
<td>average speed along slope</td>
<td>✓</td>
</tr>
<tr>
<td>average vertical velocity</td>
<td></td>
</tr>
<tr>
<td>change in gravitational potential energy when the shoe slides down the slope</td>
<td></td>
</tr>
<tr>
<td>average momentum of the shoe down the slope</td>
<td></td>
</tr>
</tbody>
</table>

[4]
(d) As the shoe moves down the slope, it speeds up.

On the axes below, sketch the shape of the velocity-time graph that shows the velocity of the shoe along the slope.
A simple roller coaster has one line of track on which a vehicle travels backwards and forwards.

- The vehicle is pulled up the left side of the track, and is then released.
- It travels down the track, speeding up as it moves.
- It rises up the right side of the track, slowing down as it moves upwards.
- It rolls back down.
- It moves backwards and forwards on the track several times, with each move becoming lower and lower and the top speed becoming slower and slower.

Use ideas of energy to explain the motion of the vehicle.

*The quality of written communication will be assessed in your answer.*
