Equations in physics

$(\text{final speed})^2 - (\text{initial speed})^2 = 2 \times \text{acceleration} \times \text{distance}$

change in internal energy = mass x specific heat capacity x change in temperature

energy for a change of state = mass x specific latent heat

energy stored in a stretched spring = ½ x spring constant x $(\text{extension})^2$

potential difference across primary coil x current in primary coil = potential difference across secondary coil x current in secondary coil

force on a conductor (at right angles to a magnetic field) carrying a current = magnetic flux density x current x length
