# **Candidate Marks Report**

## Series : 6 2018

This candidate's script has been assessed using On-Screen Marking. The marks are therefore not shown on the script itself, but are summarised in the table below.

Centre No :	Assessment Code :	H460
Candidate No :	Component Code :	02
Candidate Name :	-	

Total Marks :

In the table below 'Total Mark' records the mark scored by this candidate. 'Max Mark' records the Maximum Mark available for the question.

#### SECTION A

Read the following stimulus material and answer all parts of question 1 which follow in this section.

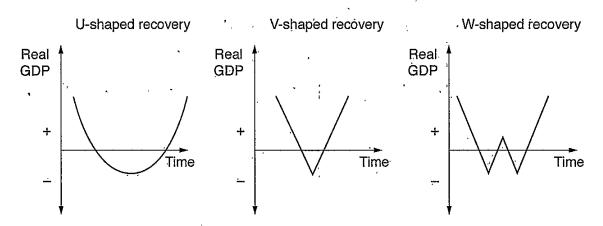

#### The recovery of the Icelandic economy

In the last two decades the Icelandic economy has experienced some significant changes in economic activity. One influencing factor has been changes in the standard rate of income tax. The rate was cut in a number of stages from 46% to 36% in 2006. Despite the lower income tax rate, government income tax revenue rose, allowing the government to spend more on the country's infrastructure. In 2009 and 2010 the income tax rate was increased.

In the period 2008 to 2011, the economy experienced a serious recession. The country's three largest banks were allowed to fail. It was the third largest bankruptcy in history and, according to the size of the economy, the biggest banking failure in history. The value of the country's stock market fell by 95%, the currency declined in value by 60%, unemployment increased by 8% and inflation rose to 12%.

From 2011 the economy has made a remarkable recovery. In 2014 its real GDP was US\$14.85bn and it grew by 4% in 2015, one of the fastest rates in Europe. Economists have developed an 'alphabet' of recoveries with the three most common types shown in Fig. 1.

0.0.0.0.0.0.0.0.0.0.0

#### Fig. 1 Different types of economic recovery

In 2015 the Icelandic government was paying back its loans to the International Monetary Fund
early. It had removed capital controls and had reformed the country's financial sector. A number of
the country's industries were expanding, most noticeably its tourist industry. Income from tourism
can fluctuate significantly. In 2015 the total contribution of Iceland's tourist industry to the country's
GDP was 23%. The impressive growth of Iceland's tourist industry was contributing to a fall in
unemployment due to a rise in hotel construction, and an increase in infrastructure, although this
was also putting pressure on house prices as people were buying them to rent out to tourists. In

2015 the unemployment rate was 5.3%, which was lower than in many European countries, but it was predicted to rise in 2016.

.5

For a small country with a population of only 0.33 million in 2014, Iceland has a relatively high HDI value. Fig. 2 shows some details of the HDI values of six countries.

Country	HDI ranking 2014	HDI value 2014	GNI per capita (US\$) 2014
Norway	1	0.944	64,992
Australia	2	0.935	42,261
Germany ·	6 ,	0.916	43,918 '
USA	8	0.915	.52,947
UK	14	0.907.	39,267
lcéland	16	0.898	35,182

### Fig. 2 The Human Development Index of six selected countries

<sup>25</sup> As Iceland's economy has grown, so has the country's aid for developing countries. In 2013, for instance, its foreign aid budget increased by 27.8%.

DCR 2018

0009544039912

Answer 13 The accelerator is a theory which shows the levels of investment in an economy depends on the change real output. ĨΛ Economic feal. Gill 72 point A, firms feel confident about the future as increasing so investment levels are high. At the the growth is slowing down in the economy Doint certainty and confidence falls which courses investments all. Although there is still growth, the accelerator ll. Although the accelerator gowth steardo slow-doin rowi us that has caused investments to decrease. At point C; investment will be low as the country still has Still spare capacity as, before it was operating at B which higher than C. Any investment and to replace old or broken machines. However, this theory assumes that nothing else affects the level of investment but are other factors such as whether In reality - there sing from has the ability to invest or to invest even if the economy is actually wan growing. This means that the accelerator may not be a good explanation for the level of investment. Turn over © OCR 2018

E.

14 Another explanation for the level of investment within' a economy could be the credit multiplier. This is theory where banks hold a reserve ration of what savers deposit and lend art the rest This gives the banks more money to lend out for ims so that they can increase investment 11th increases investment in the economy corrowing. which could explain the level of investment. However, the savers do not this only works y mate bank run. This is where savers go back to the bank of their savings in which case the and request all credit multiplier would erow Moreover, another explanation for the level of investment In a economy could be that the government policy being implemented. If there is a expansionary monetary policy, this would mean that interest rates there is an ease off credit supply re low and which means loans are cheaper and easier to obtain. a firm wants to borrow money and they are in good financial position to do so, the extra money be used for investment thus, increasing the vel of investment in an economy. However, This. whether firm are confident about the witting to invest. If the economy is Future and are a recession, then Firms may be reluctant to INVEST

© OCR 2018

15 Overall, I think that the accelerator connot explain to a small extent, the level of investment in the economy for Poland, investment has fluctuated from 8.3% to 6.8%. this to 12.7%. There could be Other reasons for this other than the change in output for example: loans are easier to obtain so firms can borrow more thus, increasing investment. END OF QUESTION PAPER © OCR 2018
